

EASTERN ATHABASCA REGIONAL MONITORING PROGRAM

2021/2022 COMMUNITY REPORT

FINAL REPORT

October 2022

Acknowledgments

The Eastern Athabasca Regional Monitoring Program (EARMP) is conducted in partnership with the Government of Saskatchewan, The Canadian Nuclear Safety Commission, and industry partners Cameco Corporation (Cameco) and Orano Canada Inc. (Orano).

The Executive Summary Dene translation was provided by Rosalie Tsannie-Burseth.

The EARMP steering committee would like to thank the Athabasca residents and communities who have donated their time and traditional foods over the years and for their continued support for the program. Community member participation and local knowledge are essential to the success of the program.

For more information on the program and additional reports please visit us at www.earmp.com

Executive Summary

The Eastern Athabasca Regional Monitoring Program was established in 2011 under the Province of Saskatchewan's Boreal Watershed Initiative. The community component of the program partners with communities within the Athabasca Basin to monitor the safety of traditionally harvested country foods by collecting and testing representative water, fish, berry, bird, and mammal tissue samples from the seven communities located in the region. Harvesting and consuming traditional foods are an important part of the culture in northern Saskatchewan which contributes to an overall healthy lifestyle through physical activity and healthy eating. Community members collected and submitted 60 fish samples, 18 bird samples, 13 small mammal samples, and 6 water samples for testing in late 2021 and early 2022. The current year's program results show that country foods are safe for consumption with chemical profiles for water, fish, small mammal, and bird tissue samples generally similar to previous monitoring years and natural background.

INTRODUCTION

Background

The EARMP is a collaborative industry-government partnership, long-term environmental monitoring program established in 2011 under the Province of Saskatchewan's Boreal Watershed Initiative. The program is supported by contributions from several stakeholders including the Saskatchewan Ministry of Environment, the Canadian Nuclear Safety Commission, Cameco, and Orano. One of the primary goals of the Boreal Watershed Initiative was to assess the ecological integrity of Saskatchewan's northern watersheds to address potential environmental concerns, and to identify sustainable management practices in the region. The EARMP was designed to identify potential cumulative effects downstream of uranium mining and milling operations in the Eastern Athabasca region of northern Saskatchewan (Figure 1).

Cumulative effects are defined as impacts on the environment that result from the impact of an action when added to other past, present, and foreseeable future actions (Joint Panel 1992). Cumulative effects might occur when projects overlap in an area (spatially), such as when two watersheds (rivers and streams), exposed to uranium mining and milling activities, converge. Cumulative effects may also occur overtime (temporally) if contaminants are emitted into the environment over extended periods. The EARMP was

Figure 1 Study location.

by federal and provincial agencies including the Canadian Nuclear Safety Commission, the Saskatchewan Ministry of Environment, and Environment and Climate Change Canada. In addition, community sampling has occurred through the Athabasca Working Group Environmental Monitoring Program for 18 years (2000-2017) and continues today as the Community-Based Environmental Monitoring Program under the Ya’Thi Néné Collaboration Agreement. The EARMP is designed to complement these monitoring programs and allows a more comprehensive evaluation of potential cumulative effects from industry in northern Saskatchewan. A full description of the EARMP study design is provided in Appendix A.

The EARMP framework includes two programs: a technical program and a community program. The technical monitoring program was established to monitor potential long-term changes in the aquatic environment far-downstream of uranium mining and milling operations in the Eastern Athabasca region. Sampling was last completed by CanNorth in 2015 and information from the technical monitoring program is presented in a separate report which can be viewed on the EARMP web-

site (www.earmp.com). The community program monitors the safety of traditionally harvested country foods by collecting and testing water, fish, berry, mammal, and avian tissue samples from the seven communities located in the Athabasca region. The community program results for the last 11 years (2011-2021) can be viewed on the EARMP website (www.earmp.ca). The objective of this document is to present a summary of the results of the community program conducted in 2021/2022.

“Gathering and eating traditional country foods can help reduce the risk of diabetes, heart disease, and obesity, especially when the foods are cooked in traditional ways.”

Dr. James Irvine – Saskatchewan Population Health Unit

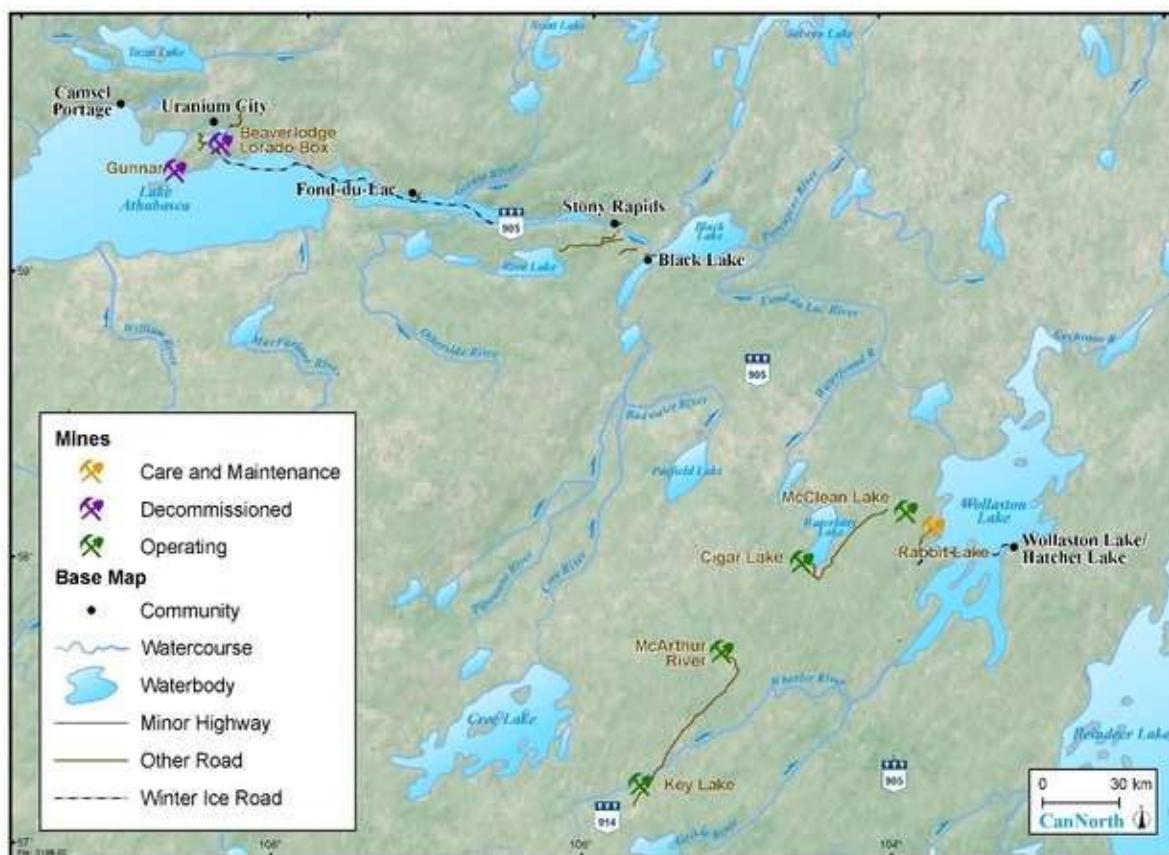

Uranium Mining and Milling Operations in the Region

As a result of the ongoing COVID-19 pandemic, both the active mine (Cigar Lake) and active mill (McLean Lake) in the Eastern Athabasca region remained in a state of care and maintenance during the 2020 EARMP field season but reopened in 2021 and was operational during the 2021 EARMP field season. Additional mine and mill operations in the region (i.e., Key Lake, McArthur River, and Rabbit Lake) were previously placed into care and maintenance due to market forces. In February 2022 it was announced that the Key Lake and McArthur River operations would begin a gradual return to production. In addition, other closed,

decommissioned, and/or abandoned uranium mine sites are located in the region and near the community of Uranium City. The locations of these uranium mining and milling operations are presented in *Figure 2*.

Extensive monitoring within the local study areas of each of the uranium mines/mills generally includes testing the air, soil, vegetation, water, sediment, benthic invertebrates, and fish (AREVA 2016; CanNorth 2016, 2018a, 2020a, 2020b, 2020c). These monitoring programs are designed specifically for each mine and are a requirement under the provincial operating licence and the CNSC Licenses as documented in the facilities Licence Conditions Handbook.

Figure 2 Study area overview.

Communities in the Region

There are seven communities in the region, including Black Lake Denesuline First Nation, Fond du Lac Denesuline First Nation, Stony Rapids, Wollaston Lake, Hatchet Lake Denesuline First Nation, Camsell Portage, and Uranium City (*Figure 2*). For the 2021/2022 community monitoring program, the communities of Wollaston Lake and Hatchet Lake Denesuline First Nation were assessed together for a total of six study areas.

Community Monitoring Program Objectives

The community monitoring program was developed to address potential concerns about the safety of traditional foods that community members routinely consume.

Above: George St. Pierre of Hatchet Lake First Nation on Wollaston Lake, Saskatchewan.

A number of traditional food studies have been completed in communities across northern Saskatchewan including Hatchet Lake Denesuline First Nation, Uranium City, the Lac La Ronge Indian Band, and English River First Nation, and have established that fish, berries,

and wild game are extremely important food sources for these northern communities (CanNorth 1999, 2011, 2014, 2017).

In 2018, a human health risk assessment was completed using all the available chemistry data collected from 2011 to 2017. The assessment determined that the level of chemicals of interest in the traditional foods were safe and do not pose health risks to members of the Athabasca Basin communities. The risk assessment is available in the 2017/2018 community monitoring report (CanNorth 2018b).

The community monitoring program objectives are to:

Determine the safety of traditionally harvested food for local consumption.

Establish long-term monitoring at community harvesting areas to assess changes over time.

Foster confidence in the consumption of traditional foods as well as engage and involve community members in the gathering of information.

Communicate monitoring results through reporting, meetings, and public media.

Summary of EARMP Community Monitoring Program Framework

Community Involvement

Above: Wayne Powder collecting water samples near Uranium City, Saskatchewan.

The community monitoring program relies on the participation of community members for the selection of sampling locations and for sample collection.

Community members play a role in every step of the process:

Community Representatives

In 2011, community members selected representatives from each community to carry out the annual country food sample collection.

The selected representatives were provided training in sample collection, storage, and shipping procedures.

Sample Locations

One water sample location was selected for each community for consistency. Fish, berry, bird, and mammal samples are collected from locations where community members routinely fish, gather and hunt.

Sample Collection

Each year, community representatives aim to collect five samples of each food type from each community.

Sample Testing

Collected samples are shipped to CanNorth for laboratory testing by Saskatchewan Research Council. Results are analysed by CanNorth and compared to available guidelines, other data collected in the region, and the most recent human health risk assessment.

Sharing Results

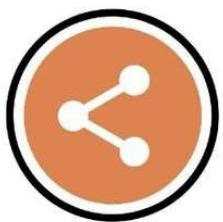

Results are shared with the communities and are available to the public at www.earmp.com.

Sharing the monitoring results is one of the primary goals of the community program. To accomplish this, communication and engagement strategies are implemented and are summarized below:

WWW.EARMP.COM

In 2020 the EARMP website was updated to improve the ease at which communities can access information and encourage community engagement.

SOCIAL MEDIA

Social media will be used as a promotional tool starting in 2020 through:
@CanNorthEnviroServices
linkedin.com/company/cannorth

CALENDARS

Free EARMP calendars in English, Cree, and Dene are distributed to the Athabasca communities and other northern communities and circulated through the band offices, community health centers, post offices, and schools annually.

PRESENTATIONS

Results are presented annually to the northern Saskatchewan Environmental Quality Committee in La Ronge.

Study Design and Objectives of the 2021/2022 Program

The community monitoring program continues to follow the study design and objectives outlined in the EARMP Community Program Framework (Appendix A), and consists of comparison to baseline data, regional reference data, and the most recent human health risk assessment (CanNorth 2018b). The study focuses on key chemicals of interest including the metals; aluminum, arsenic, cadmium, cobalt, copper, iron, lead, molybdenum, nickel, selenium, uranium, vanadium, and zinc. Radionuclides including lead-210, polonium-210, radium-226, and thorium-230 are also a primary focus. Ammonia in water and mercury in fish are also addressed. Note, all of these are present naturally in the environment but can become elevated due to mining and other industrial development activities.

The program is completed annually with the core components of water and fish sampled each year. A traditional food item is also selected each year as an additional sampling component. This year's additional focal items were snowshoe hare and spruce grouse. A portion of the budget is also set aside to support chemical analyses of opportunistic samples submitted by the community; however, there were no opportunistic samples submitted for the 2021 program. These community-requested samples can range from additional core samples or may be uniquely harvested species or specimens not historically part of the program (berries or animals hunted) or involve samples which have generated some community concern or interest.

The 2021/2022 program collected the core elements (water and fish), with snowshoe hare

and spruce grouse being the additional focal food for the year.

Results

The community monitoring report is subdivided into four sections:

-  Water (Tuítäedi) Chemistry
-  Fish (Łue) Chemistry
-  Mammal (Ch'adi) Chemistry
-  Bird (Dët'anı) Chemistry

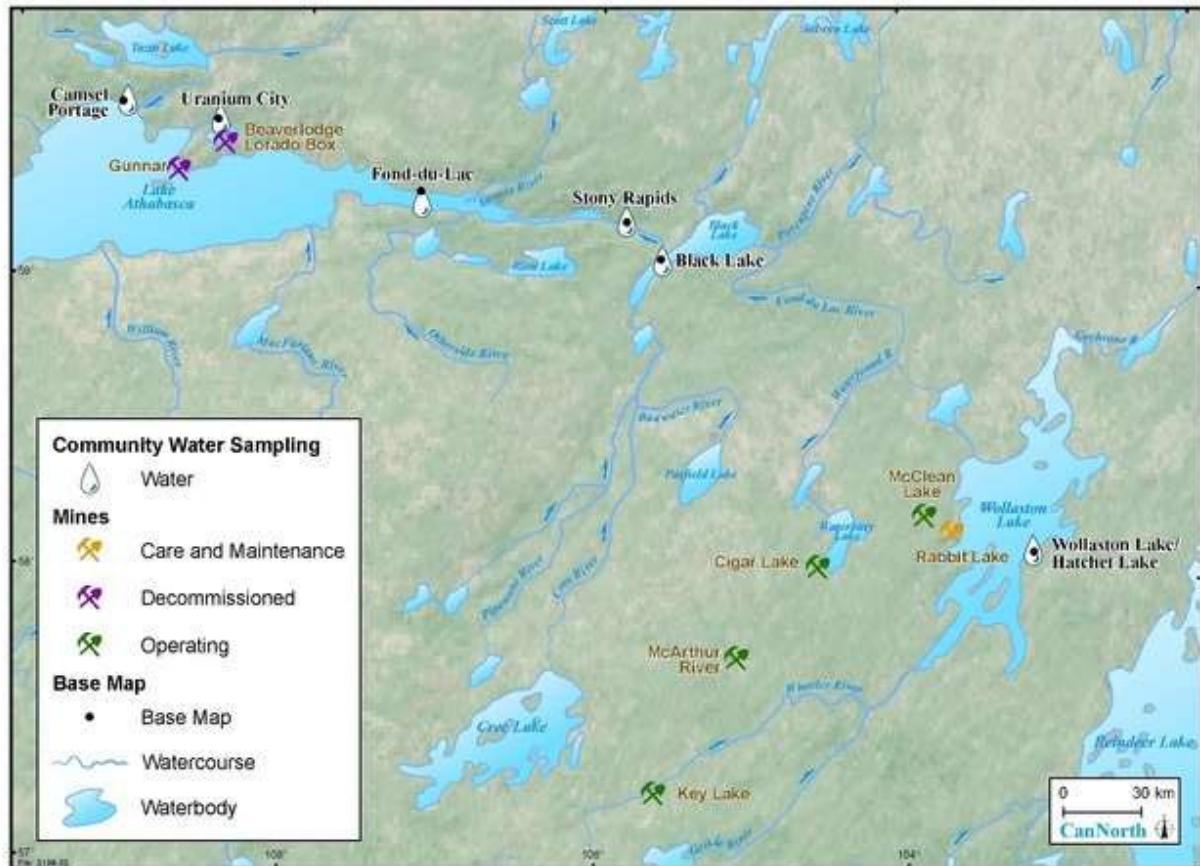

Appendix A provides a description of the community monitoring program framework, Appendix B presents a summary of the chemistry results, and detailed results from all sampling years are provided in Appendix C.

WATER (TUÎTÅEDI) CHEMISTRY

Surface water samples have been collected by hand at one waterbody of interest near each community by community members and CanNorth field staff, annually, since 2011 (baseline), with the exception of Camsell Portage in 2018 and 2020. Camsell Portage could not be sampled in 2020 due to the small population size and Covid-19 restrictions. Waterbodies assessed included Black Lake, Ellis Bay of Lake Athabasca near Camsell Portage, the Fond du Lac River near Fond du Lac, the Fond du

Lac River near Stony Rapids, the Fredette River near Uranium City, and Welcome Bay of Wollaston Lake (*Figure 3*). All samples were preserved as required and kept refrigerated until chemical analysis was completed. All water samples were submitted to the Saskatchewan Research Council analytical laboratory for chemical analysis. The summary water quality data is presented in Appendix B, Figure 1; Table 1 and summarized below. The raw water quality data are presented in Appendix C, Table 1.

Figure 3 Water quality sampling areas, 2011 to 2021

Concentrations of chemicals in the water over the years are very low, with most chemicals at levels so low the laboratory could not measure them even with the use of laboratory techniques known for their ability to measure low levels of chemicals. Chemicals that were at measurable levels were all lower than the Canadian Drinking Water Quality guidelines (Health Canada 2017) and the Saskatchewan Environmental Quality Guidelines for the protection of freshwater aquatic life (GS 2021). In addition, the pH at all locations was within the guideline range. Most of the chemical levels were within the range of concentrations expected for the region and the baseline assessment. The only exception was the 2021 sample from the Fond du Lac study area. This sample contained higher levels of some metals compared to previous years; though all values remained below the applicable guidelines. It is not known why these levels were higher. Due to travel restrictions and human health precautions CanNorth was not present during the sample collection as normal. Fond du Lac residents can rest assured that water quality

Summary of Water

Within Guidelines?

Similar to Baseline?

Similar to Regional Reference Range?

Safe to Drink?

will be monitored again in 2022/2023 and compared to previous results.

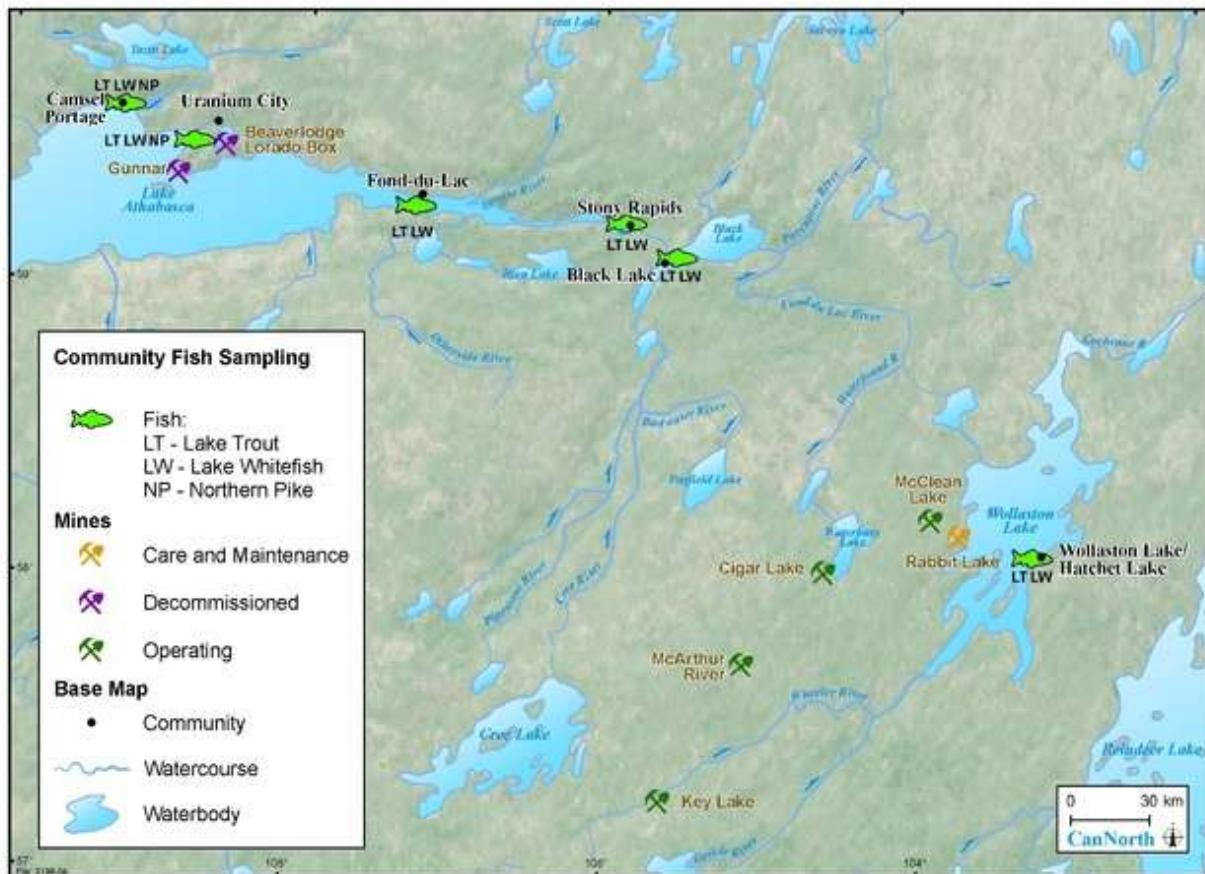

Overall, the concentrations of the chemicals assessed in the community water samples since the baseline sampling years (2011-2012) are very low and are not considered a concern to the environment or human health. Community members should note that drinking raw water from any source does carry a risk of ingesting natural parasites that can result in gastro-intestinal infections.

FISH (ŁUE) CHEMISTRY

Fish chemistry samples were collected by community members using gill nets set at waterbodies near their communities, or by angling. Fish collected have included lake trout (łuezané), lake whitefish (łú), and northern pike (oulday) (*Figure 4*). In 2021, lake trout and lake whitefish were collected from all communities. Ageing structures (fish scales and ear bones)

were removed and submitted to a specialized laboratory to determine the age of the fish. The fish flesh was submitted to the Saskatchewan Research Council for chemical analysis. The data are summarized in detail in Appendix B, Table 2 and raw data are provided in Appendix C, Table 2.

Figure 4 Fish chemistry sampling areas, 2011 to 2021

Similar to the water chemistry results, the general levels of the chemicals in fish continued to be very low in 2021, with most chemicals at levels so low the laboratory could not measure them even with the use of laboratory techniques known for their ability to measure low levels of chemicals. Chemicals that were measurable in 2021 were within the regional reference range and comparable to concentrations measured during previous monitoring years with few exceptions. Chemicals that appeared higher in 2021 (mercury in lake trout from Black Lake and arsenic in lake whitefish from Uranium City and Wollaston/Hatchet Lake) were similar to past results from other EARMP communities. Selenium in lake whitefish from Uranium City was the only chemical measured outside of the reference range; however, values remained below applicable guidelines and are considered safe for consumption. All metals in lake whitefish will be monitored again in the 2022/2023 sampling program.

Summary of Fish

Similar to Baseline?

Similar to Regional Reference Range?

Safe to Eat?

Overall, the levels of chemicals assessed in the fish collected from the communities since 2011 are considered low and similar to levels assessed in the 2018 human health risk assessment that determined fish do not present health risks to Athabasca Basin residents. Mercury levels were low in fish sampled in 2021; however, it is recommended that community members consult the Saskatchewan Mercury in Fish Guidelines for additional information:

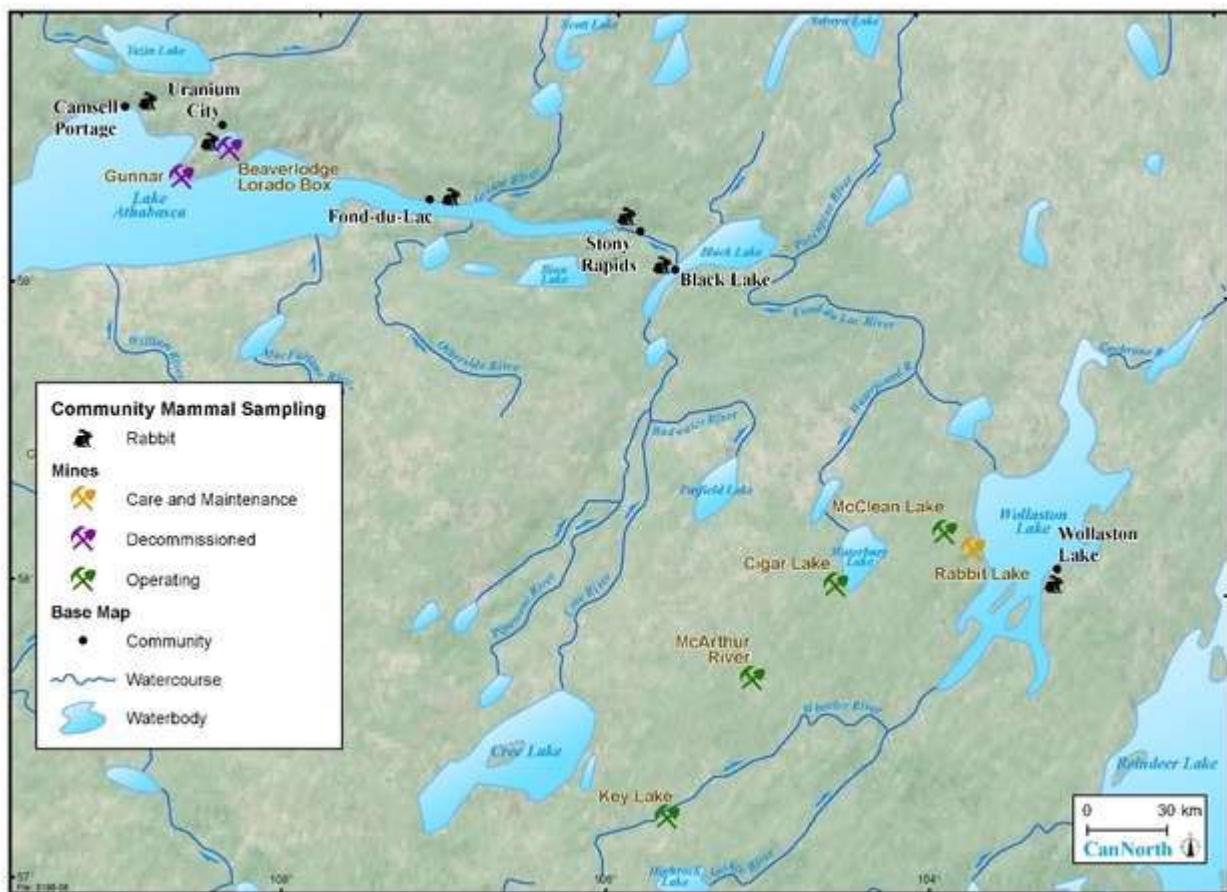

<https://publications.saskatchewan.ca/#/products/68781>

MAMMAL (CH'ADI) CHEMISTRY

One of the additional focal items of the 2021/2022 community monitoring program was small mammal tissue, specifically snowshoe hair. Samples were collected from routine hunting and trapping activities at locations depicted in (Figure 5). In 2021, snowshoe hare

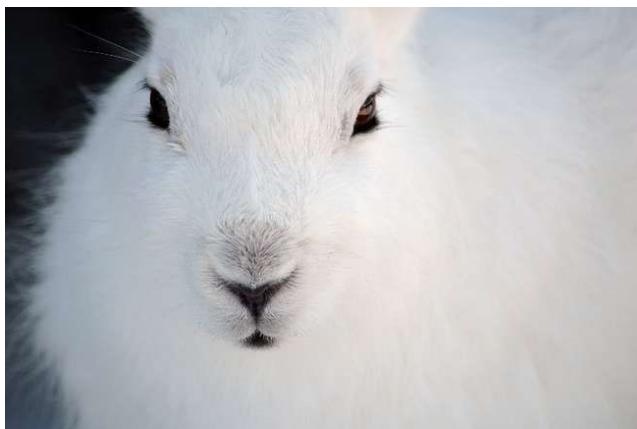

muscle meat samples were sent in by community members from Black Lake, Fond du Lac, Stony Rapids, Uranium City, and Hatchet Lake/Wollaston Lake. The data are summarized in detail in Appendix B, Table 3 while raw data are provided in Appendix C, Table 8.

Figure 5 Snowshoe hare sampling areas, 2011 to 2021

Similar to the water and fish chemistry results, the levels of the chemicals in snowshoe hare continued to be very low in 2021, with most chemicals at levels so low the laboratory could not measure them. Chemicals that were measurable were similar to concentrations measured during previous monitoring years.

However, of note was the elevated level of lead in the sample from Black Lake in 2021 which was likely contaminated by lead shot. Lead ammunition continues to be used commonly for hunting small game in Saskatchewan. Consumers should be aware of the potential risk of eating game killed by lead shot. Contamination of traditional foods by lead-based ammunition was also identified as an issue by the First Nations Food, Nutrition and Environment study (Chan et al. 2021). Studies have shown that lead gunshot undergoes

Summary of Mammals

Similar to Baseline?

Similar to Regional Reference Range?

Safe to Eat?

fragmentation on impact with game and can contaminate the meat and increase exposure of lead to those eating it. It is recommended that hunters use ammunition alternatives that are not prone to fragment including steel or other high-weight retention ammunition alternatives.

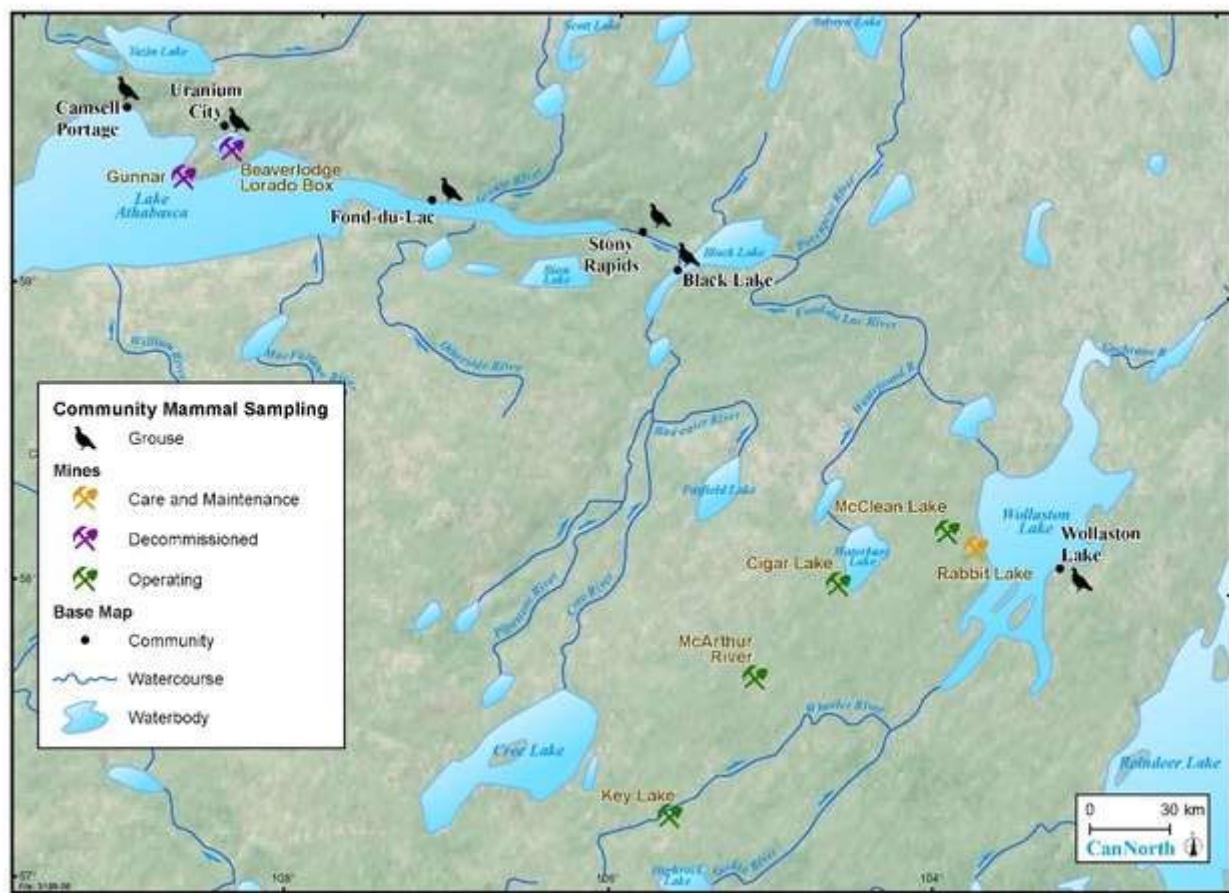

Overall, the levels of chemicals assessed in snowshoe hare muscle meat collected from the communities are considered low, and based on the 2018 human health risk assessment, the consumption of this meat by Athabasca Basin residents is considered safe.

BIRD (DET'ANJ) CHEMISTRY

The second focal item of the 2021/2022 community monitoring program was avian tissue, specifically spruce grouse. Samples were generally collected from routine hunting activities at locations depicted in (*Figure 5*). In 2021, spruce grouse muscle meat samples were

sent in by community members from Black Lake, Camsell Portage, Fond du Lac, Stony Rapids, Uranium City, and Hatchet Lake/Wollaston Lake. The data are summarized in detail in Appendix B, Table 4 while raw data are provided in Appendix C, Table 9.

Figure 6 Spruce grouse sampling areas, 2017 to 2021

Similar to the water, fish, and small mammal chemistry results, the levels of the chemicals in spruce grouse were generally very low in 2021, with most chemicals at levels so low the laboratory could not measure them. Chemicals that were measurable were comparable to concentrations from the previous monitoring year (2017). Spruce grouse were not collected from Camsell Portage in 2017 which means there are no previous samples to compare to. The next time spruce grouse are part of the community program they will be sampled again from Camsell Portage for molybdenum and all other metals.

Overall, the levels of chemicals assessed in spruce grouse muscle meat collected from the communities are considered low, and based on the 2018 human health risk assessment, the consumption of this meat by Athabasca Basin residents is considered safe.

None of the 2021 samples were contaminated by lead shot. However, it is noted that some of the 2017 samples contained elevated levels of lead likely due to lead shot. As discussed for snowshoe hare, the EARMP would like people to know that lead gunshot undergoes fragmentation on impact with game and can contaminate the meat and increase exposure of lead to those eating it. It is recommended that hunters use ammunition alternatives.

Summary of Mammals

Similar to Baseline?

Similar to Regional Reference Range?

Safe to Eat?

SUMMARY

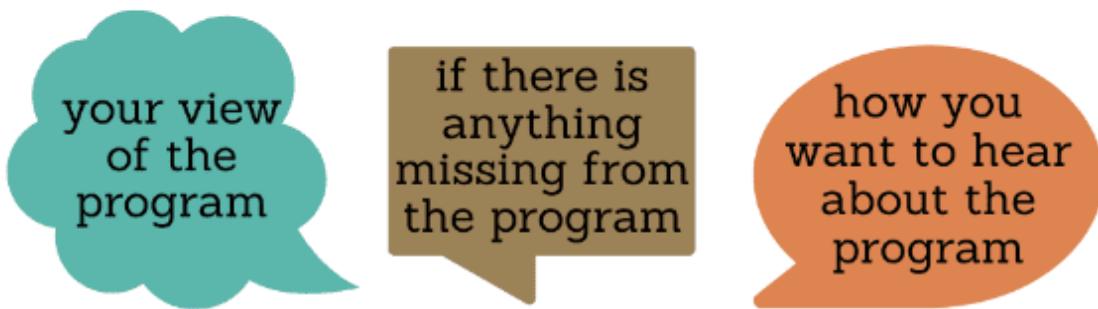

The results indicate that the measured concentrations of chemicals of interest in water, fish, small mammal, and avian samples collected and tested in 2021-2022 community monitoring program were similar to baseline and regionally measured levels. The measured concentrations were also similar to those incorporated into the last human health risk assessment completed in 2018. These community traditional foods continue to be safe and a healthy dietary choice for residents of the Athabasca basin.

EARMP COMMUNITY PROGRAM FRAMEWORK

APPENDIX A: COMMUNITY MONITORING PROGRAM FRAMEWORK

1.0 INTRODUCTION

The Eastern Athabasca Regional Monitoring Program (EARMP) is a collaborative industry-government partnership, long-term environmental monitoring program established in 2011 under the Province of Saskatchewan's Boreal Watershed Initiative. The EARMP was designed to identify potential cumulative effects downstream of uranium mining and milling operations in the Eastern Athabasca region of northern Saskatchewan. It consists of two programs: a technical monitoring program and a community monitoring program. The technical program was established to monitor long-term changes in the aquatic environment far downstream of uranium mining and milling operations in the Eastern Athabasca region. The community program was established to monitor the safety of traditionally harvested country foods from the communities located in the Eastern Athabasca region.

The following document focuses entirely on the EARMP community program. The objective of the EARMP community program framework document is to provide detailed information related to the communities and mine sites located in the Eastern Athabasca region of northern Saskatchewan, the rationale for studying country foods, detailed information and rationale on the EARMP community program study design, and details of the data analyses and communication of the results.

2.0 STUDY AREA

2.1 Communities

There are seven communities in the region including Black Lake, Camsell Portage, Fond du Lac Denesuline First Nation, Hatchet Lake Denesuline First Nation/Wollaston Lake, Stony Rapids, and Uranium City. For the EARMP community program, the communities of Wollaston Lake and Hatchet Lake Denesuline First Nation were assessed together due to their close proximity to each other, creating a total of six community study areas. Provided below are brief descriptions of each community.

2.1.1 Black Lake

The Black Lake Denesuline First Nation is situated in northern Saskatchewan's Athabasca region approximately 1,180 km northwest of Prince Albert. Access to the community is by air to Stony Rapids and then by all-weather road approximately 20 km to Black Lake. Access to the Athabasca Seasonal Road (provincial highway 905) also lies between the two communities. The community currently maintains a total registered membership of 2,283 members, with an estimated 1900 of those members residing on reserve (BLFN 2022).

The people of Black Lake initially settled at Stony Lake prior to relocating to the area currently occupied by the fishing camp on the banks of the Black Lake River. The current Black Lake community was settled in the early 1950s after a new Roman Catholic church was constructed. The Dene language is still very strong and continues to be taught by the Elders to children and youth, both at home and within the school system. The people continue to maintain their traditional lifestyle of hunting, fishing, and trapping on a year-round basis as both commercial and private pursuits (PAGC 2008, 2012).

2.1.2 Camsell Portage

Camsell Portage is a small community located on the northern shoreline of Lake Athabasca, approximately 35 km from the community of Uranium City. It remains the most northern and isolated community in the province and is only accessible by boat in the open-water season and by air year-round.

Camsell Portage was settled by trappers who arrived during the 1900s from Lac La Biche, Alberta, the Northwest Territories, and Fort Fitzgerald, Alberta and who used it as a historical portage route to the north. During peak activities near Uranium City, Camsell Portage had a population of over 300 people (P. Steene pers. comm.). The population of Camsell Portage is currently 5 people and increases to approximately 20 people in the summer months (C. Larocque. pers. comm. June 20, 2022). No mining activity has taken place in the area; however, currently there are operating hydroelectricity generating stations near the community on the Waterloo, Wellington, and Charlot river systems.

2.1.3 Fond du Lac

The Fond du Lac Denesuline First Nation is situated on the northeast shore of Lake Athabasca in the Athabasca region of northern Saskatchewan, approximately 60 km south of the Northwest

Territories border and 1,275 km northwest of Prince Albert. It currently maintains a total registered membership of 2,300 members, with more than 900 members residing on reserve and 1,300 to 1,400 members residing at locations off reserve (FDFN 2022). Members are primarily of Dene and Cree decent. Access to the community is by seasonal ice road in the winter and by boat during the summer. Two airline companies also provide year-round access to the community.

Founded over 150 years ago, Fond du Lac is one of the oldest and most remote northern communities in Saskatchewan. During Cultural Camp, the Elders share their cultural and traditional knowledge with the youth, including demonstrations in setting traps, tent raising, fire building, snowshoe racing, and preparing and smoking dry meat (PAGC 2008, 2012).

2.1.4 Hatchet Lake/Wollaston Lake

The Hatchet Lake Denesuline First Nation and the community of Wollaston Lake are situated on the south-eastern shoreline of Wollaston Lake (known in Dene as "Axe" Lake) in the Athabasca region of northern Saskatchewan, approximately 724 km northwest of Prince Albert (PAGC 2008). The Hatchet Lake Denesuline First Nation has total of 1,659 registered members, with 1,276 residing on the reserve and 377 members residing at locations off reserve (AANDC 2012). The northern settlement of Wollaston Lake has a population of 96 (SC 2021). Access to Hatchet Lake and Wollaston Lake is by ice road in the winter and by boat or barge during the open-water season. Year-round access is provided by two airline companies that operate scheduled flights between the surrounding communities and southern Saskatchewan.

Traditionally, the people lived as a hunting and gathering society with barren-ground caribou being an important food source. They still follow the seasonal caribou hunting patterns today. The majority of residents are Dene; however, during the 1950s some people of Cree-Metis ancestry moved to the northern settlement of Wollaston Lake (PAGC 2012).

2.1.5 Stony Rapids

Stony Rapids is a northern hamlet in Saskatchewan with a total population of 219 residents (SC 2021). The community is located on the shoreline of the Fond du Lac River, approximately 80 km south of the border with the Northwest Territories. The Fond du Lac River connects the community of Stony Rapids to the Fond du Lac Denesuline First Nation, Uranium City, and Camsell Portage. An all-weather road also connects the community to the Black Lake Denesuline First Nation.

2.1.6 Uranium City

The history of the Uranium City area dates back to the late 1930s when uranium ore was first discovered in the area. It was not until 1952 that the town of Uranium City was established as a base for uranium mining in the Beaverlodge area. Operations at Saskatchewan's first uranium mine began in May of 1953 and continued until June of 1982, by which time rising costs and failing ore grade made it unprofitable. Within a year following the closure of the mine, Uranium City changed from a resource town of almost 2,500 inhabitants to a northern settlement with approximately 150 residents (Bone 1998). Uranium City continued to serve as the regional base for a number of services including education, health care, and the RCMP headquarters for a number of years following the mine closure. Many public institutions closed in 1983 and the hospital closed in 2003. The current population is approximately 91 residents (SC 2021).

2.2 Uranium Operations

There are currently five uranium mines/mills in the Eastern Athabasca region. These include Key Lake, McArthur River, McClean Lake, Rabbit Lake, and Cigar Lake. In addition, the decommissioned Beaverlodge uranium mine and mill site is located within the region and near the community of Uranium City.

2.2.1 Key Lake

Cameco Corporation's (Cameco) Key Lake Operation is located in north-central Saskatchewan approximately 570 km north of Saskatoon. Mining at the Key Lake Operation began in 1982 with open pit mining of the Gaertner orebody followed by open pit mining of the Deilmann orebody beginning in 1986. Mining activities ceased in 1997 with stockpiles from the Deilmann orebody lasting until late 1999. At this time, the mill began processing ore trucked approximately 80 km from the McArthur River Operation and shifted from subaerial to subaqueous tailings management at the Deilmann Tailings Management Facility. In 2018, due to market weakness in uranium prices, Cameco suspended the production at McArthur River and Key Lake for an indeterminate duration and placed both sites in a state of care and maintenance. In February 2022, Cameco announced plans for the operation's gradual return to production.

2.2.2 McArthur River

The McArthur River Operation is located approximately 270 km north of La Ronge and 80 km north of the Key Lake Operation. It is currently the world's largest, high-grade uranium deposit.

McArthur River has been operational since 1999 and is managed and operated by Cameco. The operation includes underground mining, processing systems, an ore handling system, and camp infrastructure. Specialized mining equipment is used to extract the high-grade uranium ore and mineralized wastes are blended with high-grade ore to produce a slurry, which is trucked to the Key Lake Operation for processing and resulting tailings management.

2.2.3 McClean Lake

The McClean Lake Operation is located approximately 15 km west of Wollaston Lake in northern Saskatchewan. Orano Canada Inc. (formerly AREVA) is the majority owner (70%) and operator of the McClean Lake Operation. Exploration activities started in the late 1970s, environmental assessment in the early 1990s, and the initiation of mining and mill operations in 1996 and 1999, respectively. The McClean Lake Operation currently comprises of three main areas: the JEB area, which includes the permanent camp and the McClean Lake mill and JEB tailing management facility; the Sue mining area, which includes the mined-out Sue A/C, Sue B, and Sue E pits; and the Sink/Vulture Treated Effluent Management System (S/V TEMS).

2.2.4 Rabbit Lake

The Rabbit Lake Operation, owned and operated by Cameco, is the longest-operating uranium production facility in Saskatchewan (since 1975). It is located in northeastern Saskatchewan, on the west side of Wollaston Lake approximately 350 km north of La Ronge. The Rabbit Lake Operation includes the Eagle Point underground mine, Rabbit Lake mill, four mined-out open pit mines, of which the original Rabbit Lake pit is being used as the Rabbit Lake In-Pit Tailings Management Facility (RLTMF), the Rabbit Lake Above Ground Tailings Management Facility (AGTMF), overburden stockpiles, waste rock stockpiles, effluent treatment facilities, and camp infrastructure. Rabbit Lake was transitioned into care and maintenance in 2016.

2.2.5 Cigar Lake

The Cigar Lake Operation is located approximately 80 km west of Wollaston Lake and 40 km inside the eastern margin of the Athabasca Basin region of northern Saskatchewan. The Operation involves the construction, mining operation, and eventual decommissioning of what is currently the world's highest-grade and second largest known uranium deposit. The Operation is currently managed and operated by Cameco. The initial discovery of the Cigar Lake uranium deposit occurred in May 1981. Following the acquisition of the construction license in December 2004, underground construction activities commenced. Site construction activities were expected to

take 24 months to 36 months; however, in 2006 and 2008 the mine experienced two inflow events that caused flooding of all underground workings of the Cigar Lake Project. Cigar Lake became operational in July 2014 but was in a state of care and maintenance as a result of the COVID-19 pandemic through the 2020/2021 EARMP program, however; the mine was operational during the 2021/2022 EARMP program.

2.2.6 Other Properties

The decommissioned Eldorado uranium mining and milling operation is located approximately 8 km east of Uranium City and north-east of Beaverlodge Lake in northern Saskatchewan. The mine operated for almost 30 years between 1953 and 1982. Decommissioning of the site occurred from 1983 to 1985 and transition phase monitoring continues today. Upon its inception as a publicly traded company, Cameco was assigned responsibility for the management and reclamation of the decommissioned site. Post-decommissioning activities include the ongoing monitoring and maintenance of the site, regular water quality monitoring at stations within the area, and a variety of special investigations to assess specific environmental concerns.

In addition, Beaverlodge Lake is the receiving environment for the discharges from at least nine other abandoned uranium mine sites and one former uranium mill tailings area (the Lorado Uranium Mining Ltd. mill site), which are managed by the Saskatchewan Research Council (SRC). SRC is managing Project Cleans, which is also responsible for the assessment and reclamation of the Gunnar uranium mine and mill site and over 30 abandoned satellite mines in the Uranium City area.

The Cluff Lake Project, owned by Orano Canada Inc., is a decommissioned uranium mine and mill site located approximately 75 km south of Lake Athabasca. The Cluff Lake ore deposits were first discovered in the mid-1960s. Uranium mining and milling operations commenced in 1980 and ceased in 2002. Detailed planning for the decommissioning of the Cluff Lake Project began in 1998 and the majority of the physical decommissioning was completed in 2006. The Cluff Lake site has been in post-decommissioning monitoring since 2006 with a transition to campaign monitoring in 2013.

3.0 RATIONALE FOR STUDYING COUNTRY FOODS

The uranium mining and milling operations in northern Saskatchewan complete extensive environmental monitoring that routinely test the air, soil, vegetation, water, sediment, benthic invertebrates, and fish in their local study areas. However, these monitoring programs do not answer the question of whether country foods that are fished, hunted, or gathered near communities located downstream of multiple uranium operations are safe to eat. Since country foods, such as fish, berries, and wild game are important food sources in northern communities, the EARMP community program was developed to conduct an extensive and long-term regional sampling program testing these foods. The following section further discusses some of the uses and benefits of traditional country foods by northern residents.

3.1 Traditional Use of Country Foods

Studies conducted across Canada have documented that harvesting, sharing, and preparing traditional country foods is an important part of the Indigenous lifestyle (Wein et al. 1991; Wein and Freeman 1995; Kuhnlein and Receveur 1996; Receveur et al. 1997; AFN 2007). Traditional country food studies conducted in Hatchet Lake and Uranium City established that fish, berries, and wild game are important food sources for communities located in northern Saskatchewan (CanNorth 1999, 2011).

While fish is important to all of the communities, the relative importance of other meat sources varies. Studies have indicated that Hatchet Lake residents have a strong dependence on barren-ground caribou meat (especially during the winter months) whereas Uranium City residents rely more on moose and birds (CanNorth 1999, 2011). Uranium City residents have comparable meat/bird (grams per day) consumption values to the residents from similar regions such as Fort Smith, Northwest Territories and Fort Chipewyan, Alberta (CanNorth 2011). The more frequent caribou meat consumption in Hatchet Lake may be explained by availability, cultural differences, and/or preference of Hatchet Lake residents for caribou. A number of factors play a role in the differences in consumption patterns such as population size, road access, proximity to animal migration routes, presence of hunters, trappers, or fishermen, age and gender, costs and availability of market foods, and access to transportation with the southern part of the province (Wein et al. 1991; Blanchet et al. 2000; Batal et al. 2005).

3.2 Health Benefits of Traditional Country Foods

Harvesting and consuming traditional foods are integral components of good health among Indigenous people, influencing both physical health and social well-being. The act of hunting and gathering traditional foods is an important aspect of physical activity. Hunting, fishing, and berry picking also provides socio-cultural benefits to community members including mental health, cultural identity, and morale (AFN 2007). Gathering and eating traditional country foods can help reduce the risk of diabetes, heart disease, and obesity, especially when the foods are cooked in traditional ways (PHU AHA 2005).

Several health benefits of consuming traditional country foods have been documented across northern Canada. Fish are an important part of a healthy diet containing high-quality protein, Vitamin B, Vitamin D, omega-3 fatty acids, and other essential nutrients (NWT 2011; PHU AHA 2014). Fatty fish, such as lake trout, are especially high in omega 3 fatty acids and are considered important for heart health and brain and eye development. Compared to store-bought chicken breast and ground beef (0.10-0.31g/100g), northern Saskatchewan freshwater fish have much higher contents of omega 3 fatty acids (0.31-1.19g/100g). In addition, northern Saskatchewan fish have substantially lower levels of saturated fat, compared to store-bought chicken and ground beef (PHU AHA 2014). Fish eggs are also an excellent source of protein, Vitamin C, B vitamins, and iron (NWT 2002; NWT 2011). The skin of the fish and soups cooked with fish heads and bones are good sources of calcium (Receveur et al. 1997; NWT 2011).

Wild game meat such as moose and caribou are an important source of vitamins, minerals, and protein and have less saturated fat than store-bought meats (PHU AHA 2005; 2014). The fat content of barren-ground caribou meat is very low (1%) compared to beef, pork, or poultry (12% to 40%) (NWT 2002). Wild game are also high in essential nutrients such as iron, zinc, copper, magnesium, and phosphorous (Kuhnlein et al 1995; Receveur et al. 1997).

Compared to store-bought chicken breast and ground beef, the northern game meats have similar amounts of protein (21.4-25.6 g/100g), between 2- and 7-times higher levels of Iron (3.08-4.1 mg/100g) and fewer calories (98-123 kcal/ 100g). Overall, this indicates that northern Saskatchewan caribou, moose, and rabbit are low-calorie, nutrient dense, healthy servings of meat and meat alternatives (PHU AHA, 2014). Soups and/or stews cooked with bones for broth are high in calcium (Receveur et al. 1997), while many organs including liver contain high levels of iron needed for healthy blood and Vitamin A needed for healthy bones, skin, and teeth (HWC 1987; NWT 2002).

Traditional plants such as cranberries, blueberries, and Labrador tea are often used in both food and medicine (CanNorth 1999, 2011) and potentially offer additional health benefits. Wild plants are excellent sources of Vitamin C, fibre, and carbohydrates (Johnson et al. 1995; NWT 2002). For example, rose hips, consumed by many First Nations in a variety of medicinal and food preparations, are high in Vitamin C and demonstrate antibacterial and antioxidant properties (Yi et al. 2007).

3.3 Canada Food Guide – First Nations, Inuit, and Métis

In 2007, Health Canada introduced a newly tailored Canada Food Guide “*Eating Well with Canada's Food Guide - First Nations, Inuit and Métis*” (HC 2007) that includes both traditional country foods and store-bought foods that are generally available and accessible across Canada. This tailored food guide has recommendations for healthy eating based on science and recognizes the importance of traditional/country and store-bought foods for First Nations, Inuit, and Métis today. In addition, the government of Northwest Territories (NWT 2005) has also established a food guide that is tailored towards traditional country foods. Both the Canada Food Guide and the Northwest Territories Food Guide contain recommendations on the number of servings¹ (grams per day) of wild meats, birds, plants, fish, and other staples such as bannock, wild rice, and traditional fats. Choosing the amount and type of food recommended in Canada's Food Guide will help:

- children and teens grow and thrive;
- meet needs for vitamins, minerals, and other nutrients; and,
- lower risk of obesity, type 2 diabetes, heart disease, certain types of cancer, and osteoporosis (weak and brittle bones).

For more information on Canada's Food Guide please visit www.healthcanada.gc.ca/foodguide or “*Eating Well with Canada's Food Guide - First Nations, Inuit and Métis*” <http://www.hc-sc.gc.ca/fn-an/pubs/fnim-pnim/index-eng.php>. For more information on the Northwest Territories Food guide please visit <https://www.hss.gov.nt.ca/en/services/nutritional-food-fact-sheet-series>.

¹ It should be noted that the food guide serving size for meat and alternatives has decreased over time and each serving size recommended is 75 g, which is likely less than what most people consider a serving size. For this study, actual intake amounts were used from the area to complete the Human Health Risk Assessment.

4.0 STUDY DESIGN AND OBJECTIVES

The EARMP community monitoring program objectives are to:

1. determine the safety of traditionally harvested food for local consumption;
2. establish long-term monitoring at community sampling areas to assess variability and potential changes over time;
3. build mutually beneficial relationships and engage and involve community members in the gathering of information for the program; and
4. communicate monitoring results to community members and other stakeholders through reporting, public media, and meetings.

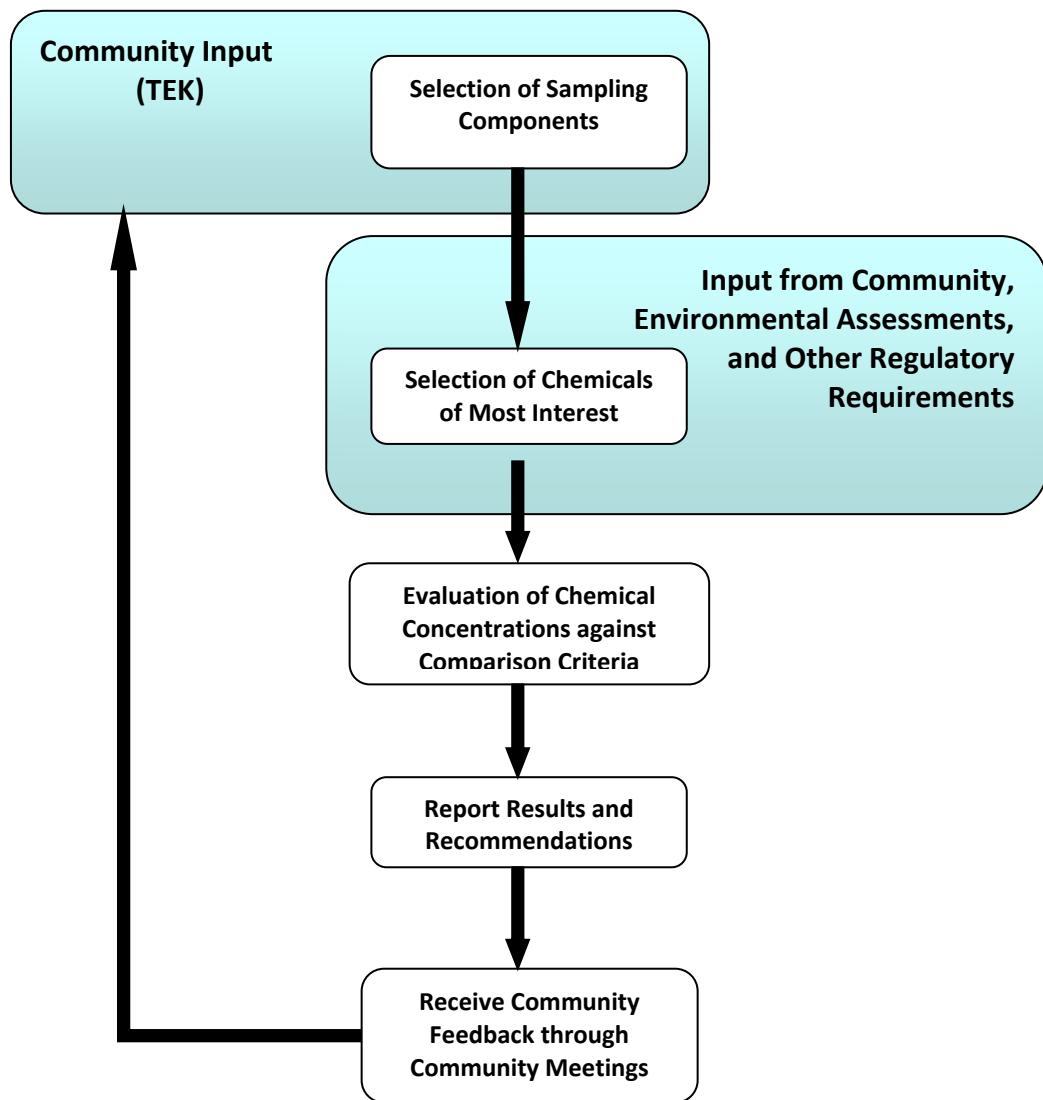

The 2011/2012 and 2012/2013 data were used to establish baseline/current conditions for each species sampled in each community area. Each subsequent monitoring year's data will be compared to this baseline in order to assess potential changes over time or temporal trends in chemical concentrations of country foods routinely eaten by residents of the Eastern Athabasca region.

The study design for the EARMP community program will remain consistent over time, to the extent possible, in order to collect a consistent long-term data set. However, the program is also adaptive and may be refined in response to new information or changes associated with the development in the region. Some things to consider moving forward include:

- Community concerns: the EARMP community program monitors endpoints of highest concern to the communities. Sampling components may be refined or expanded based on the needs of the community members.
- Regional development: the development of additional uranium mining and milling operations in the region may also influence the overall design of the program.
- EARMP Community Program results: changes to the design of the EARMP community program may occur based on results and conclusions from each monitoring year.

A key aspect of a successful community monitoring program is that the sampling locations and media are selected based on their importance to the communities and the sampling is completed by, or with, local residents. It also helps to build trust between the residents of communities and

industrial operators in the region. Traditional Ecological Knowledge (TEK) is an essential part of the program. The approach of the program is summarized in Appendix A, Figure 1.

Appendix A, Figure 1.
Summary of the EARMP community monitoring program approach.

In addition to community input, chemicals of interest are selected based on those identified through the environmental assessment process and monitoring requirements in the region. Uranium mining and milling operations are subject to the *Canadian Environmental Assessment Act* and the *Impact Assessment Act* and regulated by the Canadian Nuclear Safety Commission, the Saskatchewan Ministry of Environment, and Environment and Climate Change Canada.

4.1 Sampling Components

The program is completed annually with the core of the program involving annual sampling of water and fish along with a selected focus traditional food each year. A portion of the budget is set aside to support chemical analyses of additional samples beyond the core samples targeted for that sampling year. The country foods were selected in consultation with community members and currently include water and fish (lake trout and lake whitefish). Berries (blueberry and bog cranberry), mammals (moose, barren-ground caribou, and snowshoe hare), and birds (spruce grouse) served as additional samples in years when they were abundant. Sampling components are meant to be representative of what community members are consuming; therefore, they vary from time to time throughout the long-term monitoring program to include other components (e.g., game birds, snowshoe hare, and more).

Two dietary surveys have been completed for communities within the region: The Hatchet Lake Dietary Survey (CanNorth 1999) and the Uranium City Country Foods Study (CanNorth 2011). Country foods currently selected for the EARMP community program formed a large percentage of foods identified in these surveys.

4.2 Sampling Locations

Near each community, one station was established from which a water quality sample was obtained. The station locations were decided upon by the CanNorth staff member and the community members conducting the sampling and were determined by accessibility, water depth, and proximity to the community. Fish, berry, bird, and mammal samples were obtained from locations that community members routinely fish, gather, and hunt their traditional country foods. This ensures the sampling program is testing the study areas most relevant to the communities.

4.3 Sampling Frequency

The EARMP community program is intended to be an annual sampling campaign (every fall/winter) for the first five years, after which the sampling frequency was re-evaluated as planned. Annual sampling has continued since the program began to maintain the community relationship. To manage long-term costs not all sample media continued to be sampled every year. The program has now standardized to the collection of water and fish each year with an extra focal component (e.g., berries, moose/caribou, snowshoe hare, spruce grouse, increased fish sampling) added each year. This approach has proven to be the most efficient means of

ensuring the collection of traditional foods across all the communities with adequate replication within a single sample year for the primary media of interest (water, fish, berries, meat). The target sample size is generally five samples from each community of each media type. However, some sampling components are harder to obtain, such as moose and barren-ground caribou; thus, sample sizes may be smaller at some communities in some years.

Additionally, each year a portion of the budget is set aside to allow the program the flexibility to respond to a limited number of “community request” samples. Community request samples can range from additional core samples in the event of an especially abundant harvest, may include uniquely harvested species or specimens not historically a part of the program, or may involve samples which have generated some community concern or interest (e.g., visible abnormalities or indicators of poor health).

4.4 Laboratory Analysis

All samples are analyzed by the SRC in Saskatoon. The SRC Analytical Laboratories are certified and accredited by the Canadian Association for Laboratory Accreditation Inc. (CALA). Accreditation ensures that procedures, facilities, and methods conform to ISO/IEC 17025, which is an internationally recognized standard. SRC has an extensive Quality Assurance/Quality Control (QA/QC) program to ensure reliable analytical results. With each set of samples run, SRC tests reference materials, duplicates, and spiked samples. Data results provided by SRC include full QA/QC reports for each sample submission.

Sample analyses completed by SRC included a full suite of parameters for each media type and are described Appendix A, Table 1.

Metals and trace elements analysis are completed by ICP-MS because it is a fast, multi-elemental technique similar to ICP-AES, but with better detection limits. For most elements, ICP-MS is able to achieve detection limits similar to or lower than Graphite Furnace AAS (Wolf 2005). The analysis of metals and trace elements with ICP-MS also meets Metal and Diamond Mining Effluent Regulations (MDMER) requirements (EC 2012). However, it should be noted that even with the use of ICP-MS, concentrations of many metals and trace elements in the EARMP sampling media are at levels below the Reporting Detection Limit (RDL). In addition, RDL for radionuclides tend to vary based on the mass of the sample. For values that were below the RDL, it is not possible to determine the actual concentration; therefore, all values were set equal to the RDL for computing averages and standard deviations. This is a conservative approach as the actual concentrations could be substantially lower than the RDL.

Appendix A, Table 1

List of chemicals and supportive parameters measured in traditional foods for the EARMP community program.

Parameter		Water	Berries	Fish	Mammals	Birds
Inorganic Ions	Bicarbonate, Calcium, Carbonate, Chloride, Magnesium, Potassium, Sodium, Sulphate, Hydroxide	x				
Metals and Trace Elements	Aluminum, Antimony, Arsenic, Barium, Beryllium, Boron, Cadmium, Chromium, Cobalt, Copper, Fluoride Iron, Lead, Manganese, Mercury*, Molybdenum, Nickel, Selenium, Silver, Strontium, Thallium, Tin, Titanium, Uranium, Vanadium, Zinc	x	x	x	x	x
Nutrients	Ammonia as N, Nitrate, Total Nitrogen, Total Kjeldahl Nitrogen, Total Organic Carbon, Phosphorus	x				
Radionuclides	Lead-210, Polonium-210, Thorium-230, Radium-226	x	x	x	x	x
Physical Properties	pH, Specific Conductance, Sum of Ions, Total Alkalinity, Total Dissolved Solids, Total Hardness, Total Suspended Solids, Turbidity	x				
	% Moisture		x	x	x	x

*Water and fish only.

4.5 Data Assessment Approach

4.5.1 Endpoints

Although a full suite of chemical parameters were measured for each sample, this report focuses on a smaller list of chemicals, which have been identified as the chemicals of most interest for uranium operations by regulatory agencies, environmental assessments, as well as other monitoring programs. Appendix A, Table 2 summarizes the endpoints assessed for the EARMP Community Program. Supporting endpoints for the water quality assessment also included organic carbon, specific conductivity, total hardness, and pH.

While mercury is included in Appendix A, Table 2, it is not associated with uranium mining and milling operations. Monitoring programs completed in each mine site's local study area have repeatedly shown that mercury concentrations in the treated effluent are below the MDMER

criteria for monitoring² (EcoMetrix 2010a, 2010b; SENES 2010, 2012; AREVA 2012). Mercury occurs naturally in the environment and can be found at low levels in most soils and rocks. In northern Saskatchewan, natural deposits associated with lead, zinc, copper, silver, and gold are likely the cause of higher levels of mercury in fish in some lakes (SE 2011). Since mercury has been identified as a concern to community members in the Athabasca Region, it has been included in the assessment.

Appendix A, Table 2
Chemical endpoints selected for the EARMP.

Reduced List of Chemicals	
Aluminum	Molybdenum
Ammonia as N*	Nickel
Arsenic	Polonium-210
Cadmium	Radium-226
Cobalt	Selenium
Copper	Thorium-230
Iron	Uranium
Lead	Vanadium
Lead-210	Zinc
Mercury**	

*For water only.

**Mercury is not associated with the uranium mining and milling process.

4.5.2 Comparison Criteria

To evaluate the community data, concentrations of the reduced list of chemicals are compared to:

- available guidelines;
- available regional reference data; and
- available literature and/or Human Health Risk Assessments.

The above comparison criteria are used for each media type to establish if the country foods sampled in each community are within the expected background concentrations for the region, are below guidelines, and are considered safe to eat based on a Human Health Risk Assessment. As additional monitoring phases are completed, assessing changes in potential chemical

² If the concentrations of total mercury is less than 0.1 µg/L in 12 consecutive treated effluent samples, monitoring is not required (MDMER, Schedule 5, subsection 4(3)).

concentrations over time will be an important component of the program. Data sources for the information used are described below.

4.5.3 Data Sources

4.5.3.1 Guidelines

Federal and provincial guidelines are available for some media types assessed in the EARMP community program. These include the Canadian Drinking Water Quality Guidelines (CDWQGs; HC 2017), the Canadian Water Quality Guidelines (CWQGs) for the protection of freshwater aquatic life (CCME 2021), the Federal Environmental Quality Guidelines (FEQGs; GC 2019), and the Saskatchewan Environmental Quality Guidelines (SEQG) for the protection of freshwater aquatic life (GS 2021). For those chemicals where the values depend on hardness, the hardness concentration from each location was used to establish the guideline. Appendix A, Table 3 summarizes the guidelines used for comparison to the EARMP community data.

Appendix A, Table 3
Chemistry guidelines used for comparison to EARMP community data.

Chemical	Guideline			
	CDWQG (Drinking Water)	CEQG (Environmental)	FEQG (Environmental)	SEQG (Environmental)
Aluminum	0.1 mg/L	0.1 ¹ mg/L	-	0.1 ¹ mg/L
Ammonia as nitrogen	-	2.68-26.65 ² mg/L	-	2.68-26.65 ² mg/L
Arsenic	10 µg/L	5 µg/L	-	5 µg/L
Cadmium	0.007 mg/L	0.00004-0.0001 ³ mg/L	-	0.00004-0.0001 ³ mg/L
Cobalt	-	-	0.00078-0.0018 ³ mg/L	-
Copper	2.0 mg/L	0.002 ³ mg/L	-	0.002 ³ mg/L
Iron	0.3 mg/L	0.3 mg/L	-	0.3 mg/L
Lead	0.005 mg/L	0.001 ³ mg/L	-	0.001 ³ mg/L
Mercury	1 µg/L	0.026 µg/L	-	0.026 µg/L
Molybdenum	-	0.073 mg/L	-	31 mg/L
Nickel	-	0.025 ³ mg/L	-	0.025 ³ mg/L
Selenium	0.05 mg/L	0.001 mg/L	-	0.001 mg/L
Uranium	20 µg/L	15 µg/L	-	15 µg/L
Vanadium	-	-	0.120 mg/L	-
Zinc	5.0 mg/L	0.03 mg/L	-	0.03 mg/L
pH	7.0 to 10.5	6.5 to 9.0	-	6.5 to 9.0
Thorium-230	0.6 Bq/L	-	-	-
Radium-226	0.5 Bq/L	-	-	0.11 Bq/L
Lead-210	0.2 Bq/L	-	-	-
Polonium-210	0.1 Bq/L	-	-	-

¹Adjusted to a pH > 6.5.

²Adjusted according to water temperature and pH of each waterbody.

³Adjusted to water hardness in each waterbody.

4.5.3.2 Regional Reference Data

Regional reference data are available from a number of sources. Reference water and fish chemistry data are available from CanNorth's database. Water and fish chemistry data from several lakes north of Points North sampled between 2005 and 2014 were utilized to generate the regional reference values (Appendix A, Table 4). This included 249 water samples, 69 lake whitefish samples, and 35 lake trout samples. In 2015, additional lake trout (24 samples) were also collected from reference areas (McKenzie Lake, Henday Lake, and Riou Lake) to improve the regional reference data set to 59 samples for this species. Water samples spanned a total of 39 lakes, while lake trout data spanned 6 lakes, and lake whitefish data spanned 12 lakes. As more data become available, the regional reference data set will become more robust, particularly for the lake trout data set.

Appendix A, Table 4

EARMP regional reference range data sources for water and fish chemistry.

Factor	Water		Lake Trout Flesh	Lake Whitefish Flesh
Years ¹	2006 to 2014		2005 ² , 2010 to 2012 and 2015 ³	2006 to 2014
Areas ¹	Agent Lake	Lower Read Lake	Cree Lake	Alsask Lake
	Alsask Lake	Mad Dog Lake	Henday Lake	Cree Lake
	Bobby's Lake	McGowan Lake	Milliken Lake	Fredette Lake
	Brayden Lake	Milliken Lake	McKenzie Lake	Henday Lake
	Carys Lake	Moon Lake	Pasfield Lake	Lac Philip
	Colette Lake	Pasfield Lake	Riou Lake	Mallen Lake
	Cree Lake	Read Lake		Milliken Lake
	David Lake	Reference 2		Pasfield Lake
	East Spur Lake	Reference 3		Riou Lake
	Fredette Lake	Reference 4		Ryan Lake
	Kapesin Lake	Reference 5		Wapata Lake
	Kazz Lake	Riou Lake		West Spur Lake
	Lac Philip	Ryan Lake		
	Lake B	Shallow Lake		
	Lake C2	Slush Lake		
	Lake C3	Wapata Lake		
	Lake C4	West Spur Lake		
	Lake C5	White Lake		
	Lake C6	Yeoung Lake		
	Lake C7			

¹Not all areas were sampled all years.

²Five additional lake trout from 2005 from Henday Lake were added to improve sample sizes (n) for parameters that were less than the reporting detection limit (<RDL), namely arsenic, copper, iron, selenium, and zinc. These additional lake trout samples could not be used for other parameters because of large differences in RDLs in 2005 compared to later years.

³An additional 24 samples from Cree Lake, Henday Lake, McKenzie Lake, and Riou Lake were later included in 2015.

Historical data (2008 to 2011) available from the Athabasca Working Group (AWG) Environment Monitoring Program and the Uranium City Country Foods Program (CanNorth and SENES 2012) were utilized to generate the regional reference values for the berry data. Data from the AWG program were also used to establish regional reference ranges for the moose and barren-ground caribou data. In most cases, data from 2000 to 2010 were included in order to have adequate sample sizes; however, there were some situations where obvious and consistent changes in reporting detection limits (RDLs) precluded earlier data from being included.

Appendix A, Table 5

EARMP regional reference range data sources for berry and mammal chemistry.

Factor	Blueberries	Cranberries	Caribou Flesh	Moose Flesh	Snowshoe Hare Flesh
Years ¹	2000 to 2011	2000 to 2011	2000 to 2011	2000 to 2011	2011

¹Not all areas were sampled all years.

4.5.3.3 Human Health Risk Assessment

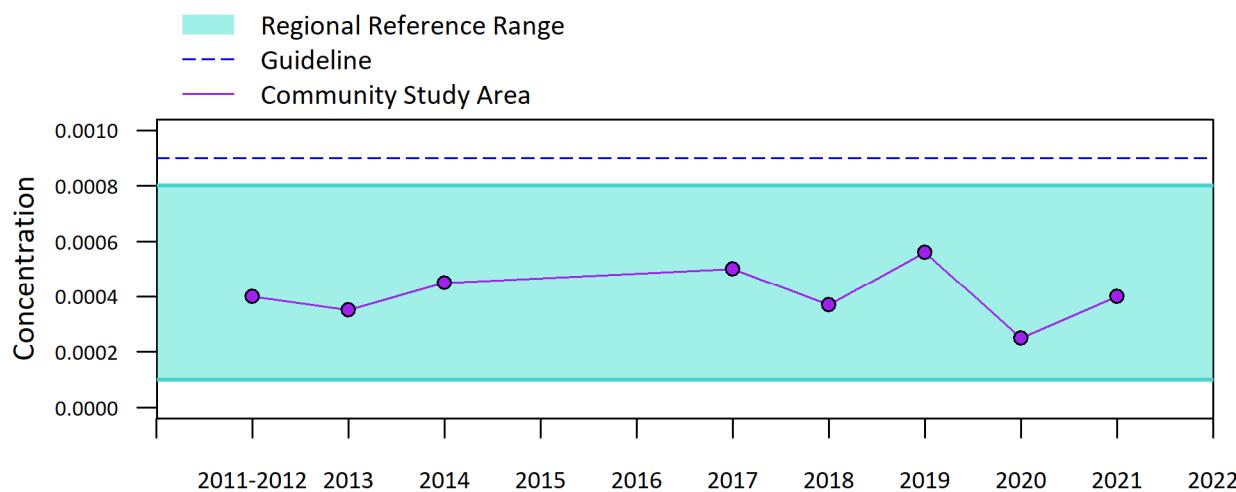

Human Health Risk Assessment is a scientific procedure that is used to assess the potential for adverse health effects to humans caused by a selected group of chemicals that are a concern. Risk assessments involve the application of a staged, formal, and reproducible process that incorporates procedures accepted by regulatory authorities. Through the completion of a Human Health Risk Assessment, it is possible to answer one of the primary questions of the EARMP community program: are country foods safe to eat?

The most recent Human Health Risk Assessment was completed in 2018 utilizing the 2011 to 2018 EARMP data and determined that the country foods were safe to eat in all communities assessed. In subsequent monitoring phases, if the levels of chemicals remain within the range of those measured during the baseline conditions, the Human Health Risk Assessment can be used as a basis for concluding if the country foods remain safe to eat. As more data become available, and potentially new types of country foods assessed, it may be necessary to complete a new Human Health Risk Assessment.

4.5.4 Data Presentation

The EARMP community data is presented using both summary tables and figures. Descriptive statistics (average and standard deviation) are calculated and reported for each chemical, media, and study area. A graphical presentation of the data is used to compare chemical concentrations to guidelines, the regional reference range, and baseline levels. Data are only graphed if >50% of the values are above the RDL.

The regional reference range has been re-assessed as the range between the 2.5% to 97.5% of the regional reference distribution (where 95% of the regional reference data are expected to fall), since it was determined the majority of the chemistry data is not normally distributed. The highest and lowest 2.5% of the reference data were identified using regression analysis of the cumulative percent frequencies of the observed reference concentrations. After identification, the highest and lowest 2.5% of the data were excluded and the remainder were used as the reference ranges representative of natural conditions. As more regional reference data becomes available, the ranges will be further refined.

Appendix A, Figure 2.

Example of how the EARMP community program results will be presented graphically during future monitoring campaigns.

Appendix A, Figure 2 shows a hypothetical figure that will be used to assess levels of chemicals in country foods. This figure provides information on guideline values, the regional reference range, and temporal changes in a single image for each chemical in each sampling component. The blue dotted line represents a guideline concentration (e.g., drinking water guidelines). The turquoise shaded area represents the regional reference range (i.e., reference average \pm 2 standard

deviations). The average concentration in the EARMP community sample is shown as a circle for the sampling years. The graph will be a very useful visual tool for assessing the EARMP community data against the comparison criteria at a glance. It will also allow for a qualitative assessment of increasing or decreasing concentrations of individual chemicals over time in each community.

5.0 REPORTING AND COMMUNICATION PLAN

A report will be completed to assess the EARMP community data following each monitoring year. The report will be structured so that the most relevant information is presented in the main document, with the detailed analysis presented in appendices. This will allow all potential audiences access to the information most relevant to them. The report, along with the raw data, will be available for download from the EARMP website: www.earmp.ca

In addition to the report, community visits may be completed to present the results of the monitoring program. Community visits may include presentations, distribution of summary brochures/calendars, school visits, and/or ads. The community visits will be an opportunity to receive feedback on the program and encourage further involvement from community members. Feedback on the program can also be provided through the EARMP website. Since 2012, the EARMP has taken the opportunity to engage communities at least annually about their environment while also distributing information about the project.

APPENDIX B

DETAILED DATA ANALYSIS

APPENDIX B: DETAILED DATA ANALYSIS

1.0 WATER QUALITY

The 2021 water quality data were assessed as per the data assessment approach described in detail in the EARMP community program framework (see Appendix A). Concentrations of the reduced chemical list were compared to:

1. Canadian Drinking Water Quality Guidelines (CDWQG; HC 2020) and the Saskatchewan Environmental Quality Guidelines (SEQG) for the protection of freshwater aquatic life (GS 2022);
2. regional reference data; and
3. previous monitoring phases.

Summaries of available guidelines, regional reference data, and the 2011 to 2021 EARMP community data are presented in Appendix B, Figure 1 and Appendix B, Table 1. Data were graphed if concentrations of a certain chemical were above the RDL in at least one community. If available, the CDWQG are presented on the graphs, since the EARMP community program is most concerned with human health. If CDWQG are not available for a certain chemical, then the SEQG were included on the graph. The detailed water chemistry results are presented in Appendix C, Table 1.

In 2021, concentrations of most chemicals were very low and in the case of the following chemicals the concentrations were at or below the lowest concentrations the laboratory can measure:

- Arsenic,
- Cadmium,
- Cobalt,
- Lead-210,
- Mercury,
- Polonium-210,
- Selenium,
- Thorium-230, and
- Vanadium.

All chemical concentrations measured near the communities were below available CDWQG or SEQG (Appendix B, Figure 1 and Appendix B, Table 1). The pH levels at all locations were within the guideline ranges. In addition, all chemicals were within the expected range for the region or similar to those measured during the baseline years with the only exceptions being some metals in the Fond du Lac sample (i.e., aluminum, copper, iron, lead, and zinc) which were higher in 2021 than previous years, but lower than the CDWQG and SEQG. It is not known why these levels were higher than in the past. Normally, a CanNorth staff member collects the water samples with assistance from a local community member; however, due to travel restrictions and health precautions taken during the COVID-19 pandemic, CanNorth was not present during sample collection in 2021 in Fond du Lac. Community members can be assured that all chemicals in the water from the Fond du Lac River will be monitored again during the 2022/2023 program. In addition, the results from the Fond du Lac River sampling location in the Stony Rapids study area did not show similar increases in the levels of metals in 2021.

Apart from the aforementioned Fond du Lac sample in 2021, there have been no apparent increases in the concentrations of the chemicals assessed in the community water samples since the baseline sampling years, and in addition, the last Human Health Risk Assessment (CanNorth 2018) indicated there was no risk; therefore, there are no concerns associated with the 2021 EARMP community water quality.

2.0 FISH CHEMISTRY

To evaluate the EARMP community fish chemistry data, concentrations of the reduced chemical list were compared to:

1. regional reference data; and
2. previous monitoring phases.

The data assessment followed the approach developed as part of the EARMP community framework (see Appendix A).

In 2021, five lake trout and five lake whitefish samples were targeted for collection and received from each community. A summary of fish descriptive statistics (length, weight, and age) is provided in Appendix B, Figure 2 and Appendix B, Figure 3. Summaries of available chemical concentrations measured in regional reference data, baseline data,

and the 2014 to 2021 EARMP community data are presented in Appendix B, Table 2. Data were graphed if >50% of the concentrations for a certain chemical were above the RDL in at least one community (Appendix B, Figure 4 and Appendix B, Figure 5). The detailed fish chemistry results are presented in Appendix C, Table 2.

Chemical concentrations in the community fish samples from 2021 were often so low that the laboratory could not measure the level. This was the case for aluminum, cadmium, cobalt, lead, molybdenum, nickel, vanadium, lead-210, polonium-210, radium-226, and thorium-230, in over half of the lake trout samples assessed in all of the communities. This was also the case for aluminum, cadmium, lead, molybdenum, nickel, vanadium, lead-210, radium-226, and thorium-230 in lake whitefish.

In lake trout, of those chemicals that were above the RDL, all were within the regional reference range and similar to concentrations measured during previous monitoring years, except mercury from Black Lake, which measured higher than the reference range and previous years but similar to the levels recorded in the Fond du Lac area in 2014. In lake whitefish, all chemicals above the RDL were within the reference range and similar to previous years, except arsenic in Uranium City and Wollaston/Hatchet Lake and selenium in Uranium City. For arsenic, the 2021 levels were greater than the reference range and previous years in the respective communities of Uranium City and Wollaston/Hatchet Lake; however, the levels were lower than past results from other EARMP communities, such as Fond du Lac in 2020, Black Lake in 2016, and Camsell Portage from 2011 to 2013. Selenium in lake whitefish from Uranium City was the highest recorded in 2021 and greater than all other communities as well as the reference range; however, the concentration remains low and well below the United States Environmental Protection Agency (U.S. EPA) selenium criterion for fish muscle tissue of 11.3 µg/g dry weight (U.S. EPA 2021) and the more recent Canadian fish whole-body environmental quality guideline of 6.7 µg/g dry weight. The 2021 Uranium City lake whitefish fish flesh when converted to dry weight averages 3.08 µg/g. Based on the information in the last Human Health Risk Assessment (HHRA; CanNorth 2018), the average adult can eat approximately 0.6 kg (1.2 pounds) of lake whitefish in a day with no concerns. While continuing to be below guidelines, results over the last few years have been increasingly variable. Upon completion of the 2022 sampling period, the complete Uranium City lake whitefish database (2011 to 2022) will be analysed for evidence of an increasing trend.

As there have been no other apparent increases in the concentrations of the chemicals assessed in the lake trout and lake whitefish community samples since the baseline sampling years, and in addition, the last HHRA indicated there was no risk, there are no concerns associated with the 2021 EARMP community fish quality. Mercury in lake trout from Black Lake, arsenic in lake whitefish from Uranium City and Wollaston/Hatchet Lake, and selenium in lake whitefish from Uranium City will be monitored again in 2022/2023 along with all chemicals in all communities.

3.0 MAMMAL CHEMISTRY

To evaluate the EARMP community snowshoe hare chemistry data, concentrations of the reduced chemical list were compared to:

1. previous monitoring phases.

Summaries of available snowshoe hare chemical concentrations data are presented in Appendix B, Table 3. No comparisons are available to regional reference due to the limited number of samples available in the region. In 2021, snowshoe hare samples from Black Lake ($n = 1$), Fond du Lac ($n = 3$), Stony Rapids ($n = 3$), Uranium City ($n = 3$), and Hatchet Lake/Wollaston Lake ($n = 3$) were submitted for chemical analysis. Note that some snowshoe hare samples for the 2021 year were collected in the first months of 2022. Data were graphed if >50% of the concentrations for a certain chemical were above the RDL in at least one community (Appendix B, Figure 6). The raw chemistry results are presented in Appendix C, Table 8.

Concentrations of chemicals that were below the RDL in more than half of the samples in all communities included aluminum, arsenic, molybdenum, nickel, uranium, vanadium, lead-210, radium-226, and thorium-230. Of the chemicals that met the graphing criteria, only lead in Black Lake and polonium-210 in Wollaston/Hatchet Lake merit further discussion.

The lead concentration measured in the single 2021 snowshoe hare sample collected at Black Lake is clearly an outlier with respect to both historical collections for this site and the other sampling areas. Similar to moose and barren-ground caribou samples collected in previous years, the high lead result is believed to be due to contamination by lead ammunition. Results such as this are often an indicator of contamination by lead

ammunition. Contamination of traditional foods by lead-based ammunition was also identified as an issue by the First Nations Food, Nutrition and Environment study (Chan et al. 2021).

Consumers should be aware of the potential risk of eating game killed by lead shot, and hunters should consider using steel or other alternatives, rather than lead shot to avoid exposure to lead that could be hazardous to both children and adults. Studies have shown that lead gunshot undergoes fragmentation on impact with game and that lead fragments cause contamination of meat and increased exposure of lead to human consumers (Tsuji et al. 2008; Iqbal et al. 2009; Pain et al. 2010).

Though average polonium-210 measured higher in 2021 in Wollaston/Hatchet Lake than any previous year in any EARMP community, it is noted that previous individual samples from Stony Rapids (2021) and Uranium City (2014) were recorded at similar levels. In addition, they were lower than the baseline levels of polonium-210 in barren-ground caribou flesh from Black Lake, Fond du Lac, Stony Rapids, and Wollaston/Hatchet Lake.

4.0 BIRD CHEMISTRY

To evaluate the EARMP community spruce grouse chemistry data, concentrations of the reduced chemical list were compared to:

1. previous monitoring phases.

Summaries of available spruce grouse chemical concentrations data are presented in Appendix B, Table 4. No comparisons are available to regional reference or baseline due to the limited number of samples available in the region. In 2021, three spruce grouse samples were collected from each community. Note the spruce grouse samples for the 2021 year from Wollaston/Hatchet Lake were collected in the first months of 2022. Data were graphed if >50% of the concentrations for a certain chemical were above the RDL in at least one community (Appendix B, Figure 7). The raw chemistry results are presented in Appendix C, Table 9.

Levels of aluminum, arsenic, cadmium, cobalt, copper, nickel, uranium, vanadium, lead-210, and radium-226 were below RDLs in more than half of the spruce grouse samples from all communities. In all but one instance, the chemicals that measured above RDLs

were similar to 2017, the only other year spruce grouse were sampled. The exception was molybdenum in Camsell Portage, which measured higher than any level in any of the other communities from 2017 to 2021. Note there was no sample collected in 2017 from Camsell Portage to compare to. Upon closer review, the relatively high average level of molybdenum was due to only one of the three samples with the remaining two samples measuring near the RDL. Molybdenum along with all metals will be monitored again in spruce grouse from Camsell Portage the next time bird tissue is a focal item of the EARMP community program.

¹All concentrations are reported on a µg/g wet weight basis, except when specified otherwise.

²Regional reference data are from reference lakes north of Point's North sampled between 2006 and 2014. The median corresponds to the 50th percentile, while the lower and upper limits are the 2.5th and 97.5th percentiles that delimit the 95% range of the reference data.

³Regional reference ranges could not be computed when all or nearly all values were lower than the reported detection limit (RDL).

⁴Insufficient sample material available for one of the samples to be analysed for Thorium-230, thus n = 3 for this parameter.

S.D. = standard deviation; standard deviations of 0 signify "no variance between samples", not "a very small variance"; while "-" indicates insufficient data to calculate S.D.

Values less than the RDL were set equal to the RDL when calculating summary statistics.

¹All concentrations are reported on a µg/g wet weight basis, except when specified otherwise.

²The 2021 samples from Wollaston/Hatchet Lake were collected in the early months of 2022.

S.D. = standard deviation; standard deviations of 0 signify "no variance between samples", not "a very small variance".

<RDL = less than the laboratory reported detection limit.

Values less than the RDL were set equal to the RDL when calculating summary statistics.
